

### 1.) Identify your problem statement :

### 2.) The dataset has the following basic information:

- Total number of rows: 1,338
- Total number of columns: 6

The columns in the dataset are:

1. **age**
2. **sex**: Categorical
3. **bmi**
4. **children**
5. **smoker**: Categorical
6. **charges**

### 3.) Mention the pre-processing method :-

**Handle Categorical Variables:**

- Use one-hot encoding to convert **sex** and **smoker** columns into numerical format.

**Feature Scaling:**

- Standardize numerical features.

**Splitting the Data:**

- Split the dataset into training and testing sets (70% training and 30% testing).

### 4.) All the research values:

**Machine Learning-Regression-R Score Values**

**Dataset: Insurance**

1. Multiple Linear Regression (R\_Score) = 0.7894790349867009

## 2. Support Vector Machine-Regression
